

ABSTRACT OF THE DISCLOSURE

A putting aid is provided that has a first and a second attachment structure, an upper alignment member disposed between and attached to the attachment structures and a lower alignment member disposed between and attached to the attachment structures, such that the alignment members are vertically aligned to define a vertical plane which is perpendicular to a putting surface. In use, a golf ball is positioned on the putting surface such that a centerline of the golf ball is aligned with the vertical plane, and thus is also aligned with the target line. The golfer then aligns the golfer's line of sight with the vertical plane such that the upper alignment member obscures the lower alignment member, aligns an aim line of a putter such that the alignment members obscure the aim line of the putter and maintains both the alignment of the golfer's line of sight and the alignment of the aim line of the putter during a putting stroke.
